Room Placement & Mounting

Volume controls need to be easily accessible and convenient for the homeowner to use. A room's entryway near the light switch is a good place to install a volume control.

The VC-5A is designed to be mounted in-wall. This can be done using any standard electrical box or P-ring. For best appearance mount the VC-5A the same height as the home's in-wall lighting switches.

Wiring Recommendations

Use good quality 16–12 AWG stranded copper speaker wire. Short runs (< 50 ft) can be 16 AWG and long runs (>100 ft) should be 12 AWG. For most runs under 100 feet 14 AWG is a very good choice that will keep losses low and help maintain good audio quality.

When putting audio wiring inside walls some area building codes specify the use of a fire rated wire such as CL-2 or CL-3. Check the local building code before installing in-wall wiring.

Never install low voltage devices, such as volume controls, inside electrical boxes containing 115-Vac wiring. Run audio wiring at least 1 foot away from 115-Vac lines and telephone lines, this can reduce noise interference. Most low voltage devices can be installed close together with no adverse effects.

Multiple volume controls can be installed using either home run wiring or daisy chain wiring. Home run wiring is generally preferred because it is more reliable, easier to troubleshoot, and easier to modify during system upgrades.

Right Speaker

50 Watt Stereo Volume Control with *Automatic* Impedance Protection

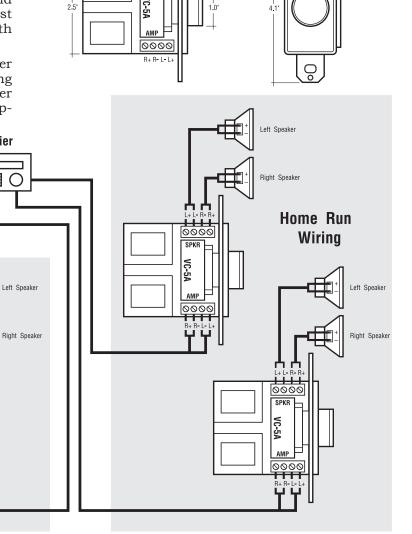

Amplifier Minimum Load	8 Ohm Speakers	4 Ohm Speakers
8 Ohms	4 Pair	2 Pair
4 Ohms	8 Pair	4 Pair
2 Ohms	16 Pair	8 Pair
1 Ohms	32 Pair	16 Pair
